a plurality of electrically conductive connecting lines electrically connected to the second electrodes and formed in a domain surrounding the display panel region on the substrate;

wherein each of the organic electroluminescent devices is formed of the first electrodes, the organic material layer and the second electrodes,

wherein the electrically conductive connecting lines are lower in resistance than the second electrodes.

2. (Amended) The organic electroluminescent display panel according to claim 1, wherein said connecting lines are constituted by electrically conductive thick portions that are thicker than said second electrodes.

3. (Amended) The organic electroluminescent display panel according to claim 1, wherein the surface area of an individual connecting line is larger than that of an individual second electrode.

4. (Amended) The organic electroluminescent display panel according to claim 1, wherein said connecting lines are made of a material that is lower in resistance than a material of said second electrodes.

5. (Amended) The organic electroluminescent display panel according to claim 2, wherein a total thickness of said connecting lines and said thick portions is larger than a film thickness of said second electrodes.
